
MEDIA RELEASE

For Immediate Release - August 16, 2016

August 16, 2016 – Four BT, LLC today announces a new industry resource to enable measurable gains in construction productivity.

Historically, the renovation, repair, maintenance, sustainability, and construction of physical infrastructure (buildings, roadways, dams, bridges, mass transit, utilities...) have faced major problems such as low productivity, waste, and negative environmental impacts. Real property owners and their service providers (architects, engineers, contractors, and construction management firms) have not been able to reverse a 30 years+ cycle of declining productivity.

There is a solution, the implementation of LEAN collaborative construction delivery methods and asset life-cycle management strategies. A combination of education, change management, robust business processes, and detailed construction cost information, and supporting technology can drive significant improvement.

Four BT, LLC announces a new industry resource that enables Facility Management Professionals and Real Property/Building Owners and their service providers to deliver over 90% of renovation, repair, and maintenance project on-time, on-budget, at the anticipated level of quality, and to the satisfaction of all stakeholders

Four BT, LLC provides services, technology, and construction cost data to enable consistent, open, transparent, and objective deployment of LEAN JOB ORDER CONTRACTING, a proven LEAN collaborative construction delivery method.
